IN THIS ISSUE

1. Therma Collaboration
2. Remote Working
3. Highlight - ZoVM
4. Getting personal

Therma Collaboration

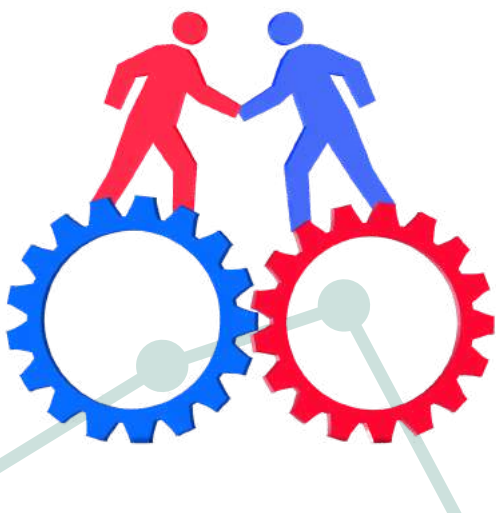

The Synergy when Hardware meets Software

June 2018 marked the completion of ZoID. ZoID aims to solve the issue of managing contact while maintaining the privacy of an individual. We did not manage to gain traction on this product.

In April 2020, Hiwonder approached Pseudoscops to explore using ZoID to complete the offering of Therma. We saw an angle where ZoID can help to manage contact tracing and subsequently bringing visitors to comply with the SafeEntry requirement of the authority, seamlessly. Thus, we embarked on the journey of Therma together, enabling Temperature Taking & Contact Tracing, introducing the OneScan to enhance the customer experience.

We are positioning Therma to stay beyond COVID-19, using the single device to enable Time Attendance & Access Control. Moving forward, we see that temperature taking is here to stay, and this will be the first line of defence for the company, right at the front.

Remote Working

Virtual meeting is getting common

Before COVID-19, it is rather challenging to get anyone to jump onto a video conference for a presentation or discussion. Most of the people will prefer just sending an email or having a physical meeting. Especially when we are trying to introduce something to our regional market, one needs to make the physical trip there.

Since the onset of COVID-19, we are to stay home, avoid physical contacts, borders are closed, and planes are not flying. People are now more receptive to remote meeting and remote working. We managed to continue our work remotely and even arranged for online presentation and demonstration to our clients.

Such will take a long time to change, if not for COVID-19 that forces us to change. With this, we are moving into the new norm where we can work beyond borders, without being physically present.

Highlight - ZoVM

Managing Visitor, Protecting Privacy

ZoVM enables facility owners to register their guest in advance and allowing them to enter your facility with ease. Easing the workload of the security team and enhancing the speed of clearance. Most importantly, the verification factor is not using our NRIC or other Personal Identification. You can do your verification using Mobile Number.

After downloading ZoVM, it enables you to set up and register for an account very quickly. You can set up the platform to facilitate the registration of guest within minutes. Administering can be done solely on mobile devices, enabling you to Managed by Device, anywhere, anytime. ZoVM can also be integrated with Therma and ZoID to give you a comprehensive solution at the front of your premises.

Getting personal

Zheng Yong | Software Developer

What's a company without the people behind, contributing to the successful delivery and working tirelessly for the customer? Pseudoscops wants to acknowledge the effort by each team member, unveiling our true identity behind the veil.

In this issue, we like to introduce you to Mr Zheng Yong, who is responsible for the success of our ZoGuard and Unity mPOS. He is also the developer working behind the scene to give Lim Chee Guan an holistic view of the business as well as the reliability of the dashboard. Thank you!

I have been learning full-stack development since I started my career as a software developer. My work includes the development of the backend system of POS and solely responsible for the Delivery App. Both development are for a famous Singapore brand, Lim Chee Guan.

The most challenging part to me is to provide a simple but reliable solution. Thinking from the perspective of the user is the key to achieve the goal. Site visiting and communicating with the customer enables me to understand their situation to have a user-friendly solution and relevant to them.
